

Permanent Hair Reduction for all Skin Types at Excelase with the

LIGHT *Sheer*[™]
diode laser system

LightSheer™ Diode Laser –
the world's most advanced treatment
for effective removal of unwanted hair.
Great news for men and women who
want to get rid of excess hair.

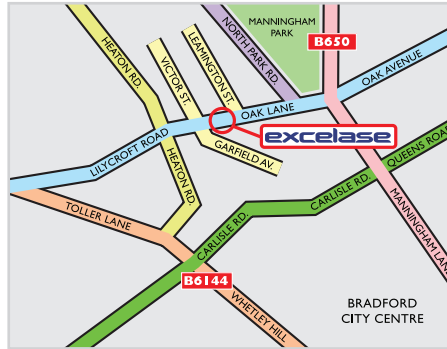

Hair's active growth phase is called anagen. During anagen, the hair contains an abundance of melanin. Hairs in this phase are most affected by treatment.

Unlike some other clinics, Excelase uses technology that targets dark hair whilst being kind to the surrounding skin.

At Excelase, our investment in the market leading LightSheer™ technology means we are confident that our clients get the best results.

LIGHT *Sheer*[™]

Permanent Hair Reduction
for all Skin Types

There is a **better solution** for removing unwanted hair

You may be surprised to learn that virtually your entire body is covered with hair. Because most of this hair is fine and pale, it usually isn't visible to the naked eye. However, for many men and women, hair can be excessively darker or coarser and appear in places that make you feel uncomfortable, affecting your confidence, relationship and life - like on the face, neck, abdomen, chest area, leg or underarms in women or on the shoulders, chest and back in men. It may be time to consider hair removal with the LightSheer™ diode laser.

Understanding **hair** removal

In the past, the usual remedies for unwanted hair included plucking, shaving, waxing or chemical depilatories. Some are painful, some are messy and all are temporary.

For long-term hair removal electrolysis is popular and effective, but it is a time-consuming procedure which can be painful and is useful only in removing hair in small areas.

During electrolysis, an electric current passes through a needle to destroy each individual hair root. It costs more, is more painful and takes months with numerous regular visits to clear even small areas, like the upper lip.

Laser hair removal is a more effective solution. The LightSheer™ diode laser is a state-of-the-art system specially designed to remove unwanted hair faster, with less discomfort and more reliably than other methods.

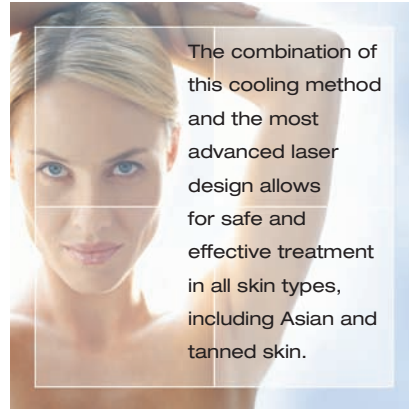

About LightSheer™ **laser** treatment

A laser produces a beam of highly concentrated light. The light emitted by the LightSheer™ diode laser is well absorbed by the pigment located in hair follicles. During the procedure the laser pulses for a fraction of a second, long enough to heat up the hair and significantly impede the follicle's ability to re-grow.

This process also treats numerous hair follicles simultaneously. Therefore, LightSheer™ is appropriate for treating even the largest areas of the body both quickly and effectively.

An important part of the procedure is the cooling of the skin.

The combination of this cooling method and the most advanced laser design allows for safe and effective treatment in all skin types, including Asian and tanned skin.

A special contact-cooling handpiece allows our fully trained staff to treat even the most sensitive skin. It protects and cools the upper layer of the skin before, during and after each laser pulse while directing the laser energy to the hair root.

What can **you** expect?

The length of a laser treatment may last anywhere from a few minutes to an hour or more, depending on the size of the area being treated. It is important to know that the hair in an active growth phase (referred to as anagen) are most affected by the laser. As all hairs are not in this phase at the same time, more than one treatment will be necessary to achieve the best result.

Some laser treatments can cause discomfort, especially in sensitive areas. However, with the LightSheer™ laser, we use a patented contact cooling handpiece for your comfort.

The appearance of the treated area immediately following treatment will vary from patient to patient depending on the extent of the procedure and skin type. Side effects, if any, are minor. Similar to other treatments, they may include a temporary redness around the hair follicle. This is nothing to worry about and indicates that the hair follicle has responded to the treatment. Most people return to normal activity right away. We will be happy to tell you more about your treatment and what results you can expect during your consultation.

At Excelase we deliver a bespoke laser hair removal service.

With our team of professionals and using the latest technology we aim to give the best results.

Excelase is fully regulated by the Care Quality Commission and our service is managed by experienced doctors who are specialists in the aesthetic field.
